

UNDERFLOOR VINYL HEATING

Dear Value Customer

You can heat up your home or office with the reassurance that Leno Vinyl Woodflex flooring is suitable for the use on top of Vinyl underfloor heating systems.

Our **2mm**, **3mm Glue down**, and our **5mm Click Vinyl range** is suitable for heating system designed for vinyl and installed professionally. The vinyl floor temperature may not exceed 27°C. While the heating system is in use vinyl floors may also not be covered with rugs as heat needs to distribute evenly throughout the floor.

We recommend Warmup's custom-laid heating elements designed for Vinyl.

Warmup's custom-laid heating elements allow full coverage of the floor, evenly heating the vinyl tiles and gently radiating warmth into the room.

As the heating solution becomes part of the floor, with no hot or moving parts, you can still enjoy an uncluttered home, as well as a maintenance-free heating system. Best of all, this clean, silent and odour-free heating solution will not dry out the air or aggravate allergies.

The cable used beneath vinyls is designed never to overheat and can be left on continuously. A floor sensor then must be used in conjunction with an intelligent Warmup thermostat to control the heating system accordingly. To ensure the vinyls are heated evenly, at least 90% of the floor space must be covered with the heating system.

For more information please do not hesitate to contact us info@carperborkers.co.za

Warm Regards
